Women are more likely to be fertile at the time of ovulation. Ovulation means when eggs are released from the ovaries.

This is the period of 12 to 14 days of your next period.

For example, if women's menses cycle is of 28 days. She had her last period on 12th of that month. Then she can be ovulating from 1st of next month. In this way, women is more likely to become pregnant just before 12 to 14 days of her menses cycle.
