Dear Tom Pullum,

Thanks for reply but I am not interested to calculate the mean number of children ever born that they are mother. I am interested to calculate the mother education data because in IR file, V149 included of women education data and in this woman also included that they are not mother. Is there any variable available that we can calculate the mother education data. any possibility? secondly, I am also asking about the variable of Marital status of women that they mentioned, not married and married. no need of the variable of woman may be widowed, remarried, etc.

Regards.
