Dear Sir,

I am very much grateful for your help . It is great support and clarity given by you to my work. But I am in dilemma as I have to correlate Uttar Pradesh district wise Neonatal, infant, postnatal and under five Mortality data with air pollution. For that I need little more accurate Stata coding and excel sheet conversion for following mentioned terms-

1. Number of live births for each year survey, including monthly/daily/yearly record of each year.
2. Number of neonatal deaths for each year survey, including monthly/daily/yearly record of each year
3. Detailed information on neonatal deaths, including but not limited to:
 - a. Causes of neonatal mortality, specifically deaths related to air pollution (if available).
 - b. Geographical distribution of neonatal deaths.
 - c. Relevant demographic information, such as age, gender, and socioeconomic status of the infants.
 - d. Any available information on the duration and intensity of air pollution exposures preceding neonatal deaths.

Date of interview, year of survey, no of observation district wise Neonatal, infant, postnatal and under five Mortality data

Regards
