Dear forum members,

I am analyzing a dataset from the Philippines 2022 on reproductive health services. For example on page 156 table 9.3.1 the total number for ANC is 2759 for livebirths and stillbirths. I am getting a larger denominator and couldn't figure out what mistake I am making. Which variable filter should I use? I was trying to use M80 but the denominator was still different from what is reported. I am using SPSS, the module for complex data, and applied weight and design effects. Your help is highly appreciated.
