Hello

I have noticed that the Indicator Data API (<https://api.dhsprogram.com/#/api-data.cfm>) contains most of the indicators I need for my research project and it is easy to merge 37 SSA countries with the rdhs, devtools packages in the r language.

Please is it appropriate to use the indicator DATA API or do I strictly have to use the individual files /datasets and calculate the indicators myself?

Please which is the recommended way?

Thank you
