Here is a simple example of creating a complex sampling plan using a women's recode (IR) data file (open the data file before running the commands):

* Create weight variable. compute wt = V005/1000000.

- * Define strata variable, sometimes V022, V023, or combination of V024 and V025. compute strata = V022.
- * or urban/rural within region.. compute strata = V024*2 + V025.

CSPLAN ANALYSIS

/PLAN FILE='C:\Temp\DHS_IR.csplan'

/PLANVARS ANALYSISWEIGHT=wt

/DESIGN STRATA= strata CLUSTER= V021

/ESTIMATOR TYPE=WR.

- * Define variable to use in analysis.
- * Secondary education or higher. compute sec = (V106 = 2 or V106 = 3).
- * Complex Samples Descriptives.

 CSDESCRIPTIVES

 /PLAN FILE = 'C:\Temp\DHS_IR.csplan'

 /SUMMARY VARIABLES = sec

 /MEAN

 /STATISTICS SE CV COUNT POPSIZE DEFF DEFFSQRT CIN

 /MISSING SCOPE = ANALYSIS CLASSMISSING = EXCLUDE.
