Hi there,

Thank you for getting back to me. If I trim and reverse vcal_1, which seems necessary for analysis, how can I also incorporate vcal_2 if I cannot trim the variable? I understand using v018 to understand its intended length, but it is already not aligned in the uncleaned data. Even with the raw variables vcal_2 does not align with vcal_1, making association difficult/impossible.

I also wanted to ask if I should be using the recode manual from DHS7 for the Kenya 2022 data for the contraceptive code - there is no recode manual for DHS8 which is Kenya's most recent.

Thank you!
