I would use the following code with an assumption that the variables in IR and MR are similar with an exception of the m prefix in the MR file

*mens recode

use "KEMR8BFL", replace

* Drop variables that will cause problems in renaming. You can handle them better!

drop m304a*

* Remove m prefix

renprefix m

tempfile MRtemp

save `MRtemp'

*individual recode

*use "KEIR8BFL", clear

* Generate gender variable

gen gender = 2

append using `MRtemp'

replace gender = 1 if mi(gender)

lab def gender 1 "Male" 2 "Female"

lab val gender gender

ta gender

Let me know in case of further questions
