Following is a response from DHS staff member, Tom Pullum:

The choice of file depends on your cases or units of analysis. I believe you are analyzing outcomes for children born in the past 5 years, so the KR file would be appropriate. That file includes most of the mother's variables from the IR file, including residence, education, and the wealth index. I suggest that you look at inequality in health outcomes by residence (v025) and region (v024), with education (v106) and wealth (v190) as mediating or intervening variables.
