Following is a response from DHS staff member, Tom Pullum:

The variables you listed for urban/rural are all the same. Type of place of residence is written (excuse the obsolete terminology!) on the cover page of the household questionnaire and is the same for the household and for everyone in it. It is also the same for all households in the same cluster and is a characteristic of the cluster or enumeration district in the sampling frame, using the definitions of the country's statistical office. It is hv025 in the household files; v025 or v102 in the women's file; and mv025 or mv102 in the men's file. 1 is urban and 2 is rural.

Hv106 is education and it also appears with hv in the household files, v in the women's file, and mv in the men's file, but it varies from one person in the household to another. In the HR file, with one record per household, the members of the household are assigned subscripts \_01, \_02, etc. which are the line number in the household listing. The PR file has household members as units and the subscripts are not needed (hvidx is the line number). For children under 5, in the PR file the mother's education is put on the child's record as hc61, just for convenience. (The mother's line number is hv112, and her value of hv106 is copied onto the child's record.) Hope this helps!
