Subject: Set up DRC data in Stata

Hello,

I would like to calculate means for a number of variables across provinces in the DRC (2007 dataset). I am not sure if the sampling procedure would preclude this and I am a little confused about how to set up my analysis (weights, strata, psu) in Stata. The main issue is that there are no reported strata (v022). I understand that the DRC had an uncommon, 3 stage sample design, but between my poor French and the new design, I'm not sure how to proceed.

Any advice would be greatly appreciated.

Thank you,

Ryan
