Thank you for your reply and clarifications.

I was able to match the respective figures for the two rounds using your revised program and the one on the GitHub for the first round. I guess my question is more about being able to compare the two time points despite small changes e.g. in the food list. In other words, whether despite the small changes in definition and program between the two rounds (e.g. that let's assume yogurt was considered liquid in round 1 but not in round 2), the % change between the two rounds would still be considered valid and meaningful.

I guess so, but I just wanted to make sure. I am looking at MAD right now, and It seems I am encountering a similar situation (but this is for a different post / topic). Thanks again.
