hello, i am trying into the women's file (IR) and want to look into how education can impact health behaviors. since my R is not able to load the whole dataset, I had to select columns to import. the hypertension, cancer or other similar biomarkers are coming as doesn't exist in R. (cc below)

```
DHSIR <- import("D:/Thesis 101/data/Individual Recode/IAIR7EFL.DTA", col_select = c("v106",  
"s116", "v025", "v101", "v130", "v190", "s728c", "v463a"))
```

```
Error in `skip_cols()`:
```

```
! Can't subset columns that don't exist.
```

Backtrace:

```
1. rio::import(...)  
3. rio:::import.rio_dta(file = file, ...)  
5. rio:::docal(haven::read_dta, ..., args = list(file = file))  
9. haven (local) `<fn>`(col_select = `<chr>`, file = `<rio_dta>`)  
10. haven:::skip_cols(...)
```

```
>
```

what is happening? is there any other way? am i doing something wrong?
