I would like to create 1 variable from hml35_a to hml35_z so that i am able to compare the frequencies in malaria and also to determine if there are any associations with fever and residential place, age, KAP etc

I also tried using sb115_01 to sb115_13 but i still can not make the single variable. The results from 01 to 56 represent all the results or a single person is designated to 01,0256 per household?
