Thank you so much once again, Bridgette.

It is very useful to confirm that 5016 is the sum of the weighted frequencies in the BR file.

And yes, I would like to restrict the data to women who are pregnant at the time of the survey (v213=1), and to the most recent birth (bidx=1) and I want to know how many of those births were before or after August 2019, by region, assuming that most pregnant women delivered one baby at their last birth.

The reasons why I am interested in before/after August 2019 are that the intervention of my interest has started since December 2018 (9 months before August 2019) and that I would like to analyze key issues around ANC service delivery.

What I still do not understand from your two useful responses is why the number of livebirths after August 2019 is different between the data from the first response (1,623.14 - weighted) and those from the second response (13.697 - unweighted)?

These numbers are supposed to be similar as no women will be able to deliver another baby from August 2019 onwards during the survey period, non?

* Number of births in the Mauritania 2019-21 survey before/after August 2019, by region

use "C:\Users\26216\ICF\Analysis - Shared Resources\Data\DHSdata\MRBR71FL.DTA", clear

* Find the cmc for August 2019

summarize b3 if b1==8 & b2==2019

* August 2019 is b3=1436

* Construct a variable for the timing of births in the birth histories

gen birthdate=1

replace birthdate=2 if b3==1436

replace birthdate=3 if b3>1436

label define bd 1 "Before August 2019" 2 "In August 2019" 3 "After August 2019"

label values birthdate bd

tab v024 birthdate [iweight=v005/1000000]

Here is the table of weighted frequencies:

	birthdate			
region	Before Au	In August	After Aug	Total
