Subject: Child vaccination Posted by shruti.acharya on Wed, 17 Apr 2024 04:24:23 GMT View Forum Message <> Reply to Message

I am new to NFHS data as well as STATA. I am trying to understand the association of socio-demographic factors with childhood immunization status (which in my case is a categorical outcome with 3 categories). I am using multinomial logistic regression on STATA using the following code :

mlogit vacc\_status(i.sex i.birth\_order) (i.Wealth i.religion i.caste i.household\_size i.v106) (i.media\_exposure i.age\_firstbirth )

The DHS Program User Forum

I have recoded the variables for better identification. I wanted to know if I need to use the "svyset linearized" everytime I run my regression on STATA, and also whether I am doing it correctly.

Thanks in advance !
