Thank you Mr. Pullum, I will post on the IPUMS forum for further clarification.

Even in the raw DHS files, the means for this variable are very different across recodes (after dividing each by 100). I don't think these are fully explained by measurement error in the height variable.

Summary for variables: hwmhtasdrm by categories of: year (Year of sample)

```
year | mean
-----+-----
2005 | -182.7139
2015 | -1.86
2020 | -14.82283
-----
Total | -52.37074
-----
```

gen haz_men = hwmhtasdrm/100

. tabstat haz_men if haz_men < 90, by(year) tabstat haz_men if haz_men < 90, by(year)

Summary for variables: haz men

by categories of: year (Year of sample)

```
year |
        mean
2005 | -1.827139
2015 | -.0186
2020 | -.1482283
-----
Total | -.5237074
```
