Hi!

I'm currently writing my thesis exploring the intention to circumcise (all) daughters in Egypt among mothers having at least one living and uncircumcised daughter, using the individual records from years 2000, 2005, 2008, 2014, and 2015. However, the variables contain a large amount missing which, according to the surveys is due to only mothers having uncircumcised daughters received the question. Though I cannot find the nr of those having any uncircumcised daughters for year 2000, 2005 and 2008 though it is available for year 2014 and 2015. Is there another way to find out what's causing the missing values for the variable: "intentions to circumcise (all) uncircumcised daughters" ?

Best, Ebba
