Thank you very much for the repply. I also need some information such as mother height, age, years of education; age and education head of household, wealth index from the IR file. By your answer, do you suggest I merged the BR with the IR? If so, what is the best way to merge 1:m using "BR" or m:1 using "IR"?

Do you also suggest I use that to calculate 'None of the basic vaccinations' and 'all of the basic vaccinations' if I want to construct variable for kids that received none of the eight basic "None of the basic vaccinations" and received "All basic vaccinations" : "bcg" "polio1" "polio2" "polio3" "measles" "dpt1" "dpt2" "dpt3"

If so, what would be the appropriate command ?
