Kenya 2014 DHS used a split sample with a long questionnaire and a short questionnaire. Some indicators can only be calculated for the half of the sample that used the long questionnaire, and that is probably the case for this indicator. Thus, you need to select for cases that used the long questionnaire. You can use v044 to identify the long questionnaire, as follows:

gen longqre = 1 if v044 != .

then select those cases with longqre == 1
