Dear Sara and SPA experts,

I am currently working with the 2014/15 Tanzania SPA survey, aiming to create the variable: equipment for high-level disinfection (referenced in table 3.5) based on the footnotes and questionnaire. However, I am unable to match the percentages presented in the final report table.

My STATA code is:

```
gen wt=facwt/1000000
```

*Equipment for high level disinfection

```
gen hldis=0
```

```
replace hldis=1 if (q201==1 | q201==2) & ((q501a_3==1 & q501b_3==1) | (q501a_5==1 &  
q501b_5==1) | (q501a_6==1 & q501a_7==1 & q501b_7==1) | (q501a_9==1 &  
inrange(q502g_5,3,5)))
```

```
tab hldis [iw=wt]
```

Is there anything else I need to consider? Would it be possible to obtain the codes for this variable? I would greatly appreciate any assistance with this matter.

Thank you very much.
