Thank you so much for the reply,

This might be a bit off topic but how did you calculate the percentage of hepatitis B birth dose vaccination in table 10.2? It has the percentage of vaccination at 0 days (at birth) and more than 1 days (in the Indonesian 2017 DHS report). How did you calculate this without the date of birth? I believe there's no specific question about it and only the date of vaccination are available. Did you calculate it with CMC or is there any other method? Can you show me how to do it in stata/spss?

Thank you so much, I really appreciate for your assistance
