Thank you so much for the swift answer - it is very helpful indeed.

I believe that I used the wrong terminology - when I wrote "merge", I meant "append". If I manage to use your program to reshape the variables, I should be able to append the India PR file to my other two PR files, and then include the data in my analysis. The hearing difficulty variable has different values than the NP and PK datasets, but I can recode them all so that they are binary and useful for my analysis.

Is it correct, then, that once this program is run, I can append the India file to the others?

Thanks in advance
