Hello everyone,

Thank you for your valuable guidance. I have also encountered difficulties in obtaining the same number of cases of acute respiratory infections (ARI) among under-five children in the Amhara region using the h31, h31b, and h31c variables from the KR file of the EDHS 2016. I followed the recommended steps, but the results do not match those in the final EDHS 2016 report. Could someone provide additional tips or common errors to check for in order to achieve consistent results?

Thank you in advance for your help!
