The GE file provides displaced GPS coordinates for each survey cluster (groups of households). The KR file provides data for every child of interviewed women, born in the five years preceding the survey. To merge the datasets, you would need to merge by the cluster number (DHSClust in GE file and v001 in KR file). For more information on merging DHS Program datasets, please see: <https://dhsprogram.com/data/Merging-Datasets.cfm>
