I am using the variable v717 (standardized occupation) for comparison across India, Pakistan and Bangladesh. the recode manual says: "Standardized respondent's occupation groups. Agricultural categories also include
fishermen, foresters and hunters and are not the basis for selection of agricultural/non agricultural workers. In countries, where it is not possible to differentiate between self employed agricultural workers and agricultural employees, no attempt has been made to use
other information, and code 4 has been used for both categories. The analyst may wish to use other related information to differentiate between these two categories.
BASE: All women"
But after running the descriptive to in stata I am getting 2 categories of variables labeled agriculture (refer to the attached document). Please help me identify my mistake looking at the attached stata output.
Thankyou
