Using multiple years BDHS IR, KR, HR and VA files for cause specific U5 analysis. So far used bord along with cluster, house & mother(respondent) to match between IR, KR files in R. Looking for a key variable to match with VA files. I am not sure what the child line number corresponds with other files! Also for analyzing the rate per cause, how should i proceed.

Thank you.

Edit: I just found out that the missing child's line number(NA) in KR or IR files are actually the one in the VA child line number.
