Hello, I have 3 questions:

1) I need to calculate and analyse Female Labour force Participation rate (as per DHS6 data) in each district of Pakistan with FLFPR as per DHS7 data using STATA. Is there any efficient way I can ensure that the districts are the same for both datasets?

2) Moreover, I want to merge the LFPR rates with CR file. Which variable can be used as an identifier?

3) Similarly, how to merge data about household head with CR file?

Thanks
