Thank you so much for your reply.

Regarding my third question, I want to use some household head characteristics (like education ) with couples data. Not all households have reported husband/wife as the head. I will therefore need to merge PR file with CR file.

What I gathered from the discussions on the forum, `hv044==1` & `hv101==1` will give us household heads for households that were selected for dom violence module. This gives us data for 5,224 individuals. CR file has data for only 3,334 couples. The number of heads cannot be higher than the number of couples. Is the difference due to non-response? Or is there an error in my method?

I am planning to then concat cluster number and household id in CR to create a unique identifier for merging with PR. Can you pls confirm if that is the correct approach?

Thanks
