This is regarding service provisions module in DHS7 for Pakistan.

For public transport, if the service (t203_03 & t203_04) is available in the village, the distance to the service (var names t204_03 and t204_04) is given as a missing value'.'
However, when the service is NOT available in that village(t203_03 ==2 or t203_04 ==2) the distance of village from the service is sometimes given zero and sometimes a missing value'.'
How should we differentiate and interpret these cases?
