Thank you for your response. I did do keep if _merge==3 I just forgot to include that. If you do know the answer to this question too that would be really helpful as well!

2) My second question is that if I were to try to run a regression on mother-in-law's education on standardized
autonomy there would either be no cases if I only run the regression on daughter-in-laws, or the regression would run solely on mother-in-laws since they are the only rows
that have values for both the educational level obtained and standardized autonomy
scale.
- Is there a way that we can construct the mother-in-law education variable to be available
or on the same row as the daughter-in-law respondents so that regression analyses can
be executed? If you know the codes for this. It would be so appreciated. Thanks.
