Thank you for your response! I was using the FP module code on GitHub which generated an fp\_cruse\_mod variable from v313.

I see now that the Bangladesh data has missing values in v313 whereas the other countries in my analysis do not have missing data in this variable so that affected my denominator. Appreciate your insight.

\*\*\* Current use of contraceptive methods \*\*\*

```
//Currently use any method  
gen fp_cruse_any = (v313>0 & v313<8)  
label var fp_cruse_any "Currently used any contraceptive method"
```

```
//Currently use modern method  
gen fp_cruse_mod = v313==3  
label var fp_cruse_mod "Currently used any modern method"
```
