Dear DHS Users,

I have observed the trend of the Median years of education completed for both men and women over the last previous KDHS surveys. In the last two KDHS surveys, the median years of education completed among the high wealth quintile declined for both men (from 11.4 in 2014 to 10 in 2022) and women (from 11.2 in 2014 to 9.8 in 2022). This appears significant and I wonder what could be the explanation. Trends in the other wealth quintile show a positive trend. My analysis is based on statcompiler.
