Thank you

Please assist me with the syntax. I obtained my previous values by not dividing v005 by 1,000,000.

*DHS setup

*USING KR file for the 2008

*weighted

gen wt=v005

svyset [pweight=wt], strata(v023)psu(v021)

* dataset for only rural Ghana

tab v025

keep if v025==2

tab v025

*Outcome

tab hw57

outcome variables

ALLanemia2

tab hw57

* adding all forms of anemia together as one ALLanemia

recode hw57(1 2 3=1 "anemia") (4 9=0 "not_anemic"), gen (ALLanemia2)

tab ALLanemia2

*RESULT

RECODE of

hw57

(anemia

level) Freq. Percent Cum.

not_anemic 526 29.48 29.48

anemia 1,258 70.52 100.00

Total 1,784 100.00

According to the GDHS 2008 report, 1426 (84.1%) children were anemic in rural Ghana.

Kindly assist me with these syntaxes, for clarity. Thank you
