Hello, I am currently studying the trends of institutional deliveries in India using NFHS 5. While the variable m15, with its 6 subscripts is a very potent data set to study the trends (in case of multiple births), I need help in assessing how many continued with Institutional Birth (IB), how many former IB moved to home births and how many moved from Home births to IB. Can you guide me with this?

Additionally, in my understanding, m15_1 is the place of the latest delivery, while m15_6 is the place of delivery 5 years ago? Can you also mention the year for m15_1 and m15_6?
