Kalkidan,

Did you try to do a [something]-to-one merge (e.g. merge 1:1 or merge m:1)? If you did, and the using data that you specified as "one" has duplicate IDs, then Stata will tell you that the variables do not uniquely identify the observations. You need to figure out whether it makes sense in your case that the using data should have more than 1 observation with the same ID, and if that is the case, then you should do a [something]-to-many merge (merge 1:m, merge m:m) instead of merge 1:1 or merge m:1.
