thank you for your help I don't know how to thank you. Right now i have two basic questions

1. can we say interpregnancy interval and preceding birth interval are the same?
2. one of my objective is to evaluate the public and clinical implication of short and long IPI on maternal and neonatal outcome. accordingly there are about five dependent variable such as birth weight, maternal anemia, postpartum hemorrhage, ect. and independent variables are short and long IPI, sex of last birth, survival status of last birth, maternal age at birth, etc. therefore can i use wighted cox regression model inorder to evaluate the impact of short and long IPI on maternal and neonatal outcome?

Thank you
