I think you need to review the questionnaire closely. Variable MV504 is only asked if the respondent is currently married or living together with someone as if married. You need to select the correct denominator before looking further at the data. Thus for MV504 you would use this only if MV501 is 1 or 2. If you tabulate MV504 with this condition you will see that there are 0.68% of values missing (code 9).
