---

I am hoping to use DHS data to run a multilevel logistic regression on gender based violence using the domestic violence module. I have heard from one source that STATA is the preferred software for multi-level modeling but I was hoping to use SPSS to run the analysis as that is the statistics software package I am most familiar with. Do you know if SPSS can adequately run multilevel logistic regression or are there caveats I should be aware of? Should I consider using STATA? It will likely be a two level or possibly three level hierarchical model. Many thanks for your input.
