---

I am wondering about the difference between data sets within Guatemala 1998-99. The 'Height and Weight Score' variables hc70, hc71, hc72, hc73 and in 'Children's Recode' variables hw5, hw8 and hw11 are both children under 6 years, their identification numbers match, yet the values are not the same. I can't visually see any pattern of skew or shift in distribution so I was wondering what is going on with those variables?

Thanks,

---
