You have to do this twice. Once for women and then once for men. Here is how to merge the AR file with the CR file for women first:

- \* Step 1: open AR file use "xxAR61FL.DTA", clear
- \* Step 2: rename identifying variables renvars hivclust hivnumb hivline / v001 v002 v003
- \* Step 3: sort by identifying variables sort v001 v002 v003
- \* Step 4: save results save "xxAR61FL\_mergeprep.DTA", replace
- \* Step 5: open IR file use "xxCR61FL.DTA", clear
- \* Step 6: sort by identifying variables sort v001 v002 v003
- \* Step 7: merge! merge v001 v002 v003 using "xxAR61FL\_mergeprep.DTA"
- \* Step 8: Keep only women drop if \_merge==2

Then rename the added hiv variables to something unique for women, e.g. rename hiv\* w\_hiv\* and repeat steps 1-8 above using mv003 instead of v003 throughout to merge the men's hiv test result and then finally rename the hiv variables to be for men, e.g. rename hiv\* m\_hiv\*
