---

Hi forum users,

I am working on the pooled datasets of Nepal DHS for 2001 and 2006. As discussed in this thread - <http://userforum.dhsprogram.com/index.php?t=msg&th=1189&start=0&S=dac787ddfcaa55c72987b9d7b09759fa>, I have already de-normalized and treated the cluster. My confusion is on how to weight after pooling as I will be only using the births for the last two years of 2001 so should I continue to use the same weights or how should I weight it??

Many thanks,

---
