Subject: Education: inconsistency b/w HV and HA variables

I am currently analysing a dataset of Colombia DHS 2010. I see inconsistency between HV106 and HA66, and HV107 and HA67 on the same individual women. I wonder why. I reviewed their definitions on the Standard Recode Manual for DHS6, but I could not find an answer. Does anyone faced this problem? Could it be a specific problem with Colombia DHS 2010 data?
