Thanks again, and yes I managed to work out the SPSS syntax from your stata example.

One last question (for the time being) concerns variable G109 in the Mali 2006 women's dataset which is "line number of daughter most recently circumcised".

Please can you tell me which variable this relates to and in which dataset. I think it is BORD\$01 etc. but would be grateful if you could confirm, as my analysis depends upon this.

For example CASEID 1 9 2, G109 tells us the line number of daughter most recently circumcised is 4, and BORD\$04 tells us this was the first born child to this woman, and then B4\$01 tells us this child is female. Is that correct? (If so, then the last born girl is not always the last daughter circumcised which is unexpected).

Many thanks

Janet
