Subject: Creating Year of Death Posted by Seets on Thu, 02 May 2013 13:19:04 GMT View Forum Message <> Reply to Message

I would like to know how to construct a variable for the year of death of a child. The year of birth is given and the age at death is given. But is there a way to simultaneously create this variable for all 16 children in the data set? This would help save me a lot of time. I am using DHS-3 India data and working with the couples file.
