Thank you very much for the advice, Trevor, it is very useful indeed!

We have two follow-up questions, if you do not mind:

Given that, as you note, only a subsample (half or one-third) of men within a certain age range are interviewed, compared to typically all women of the same (or similar) ages, we would like to confirm whether the interviewed subsamples (for both genders and combined) remain nationally representative for the relevant age groups?

Secondly, how should the new weights for the combined data be calculated?
