It is my first time to do spatial analysis. I have read through the other topics on how to do it. I am using GIS and DHS data for Zimbabwe, Malawi and Lesotho. I have downloaded the boundaries for the surveys from spatial repository, made a spatial join for the two shapefiles, joined the Household and GIS data using clusterid, dropped clusters with 0 co-ordinates. When I do a cluster and outlier analysis using ARCGIS only Lesotho works and the other two give a warning: Distances for geographic coordinates but when I do analysis on the clusters (which is not encouraged because the three datasets are representative only at regional level I get results. Anybody who has experienced the same problem or can help?
