## Dear User,

Here is a response from one of our experts, Dr. Tom Pullum:

Quote:I would use the following sequence, in Stata terminology (I do not use SAS). First, in the male file, rename the mv\* variables to be v\*. Then append one file to the other. This is not a merge, it is an append. Then rename v001 to be hv001, v002 to be hv002, and v003 to be hvidx. Then sort the combined file on hv001, hv002, hvidx. Save with a temporary file name such as "IR\_MR\_temp.dta". Then open the PR file, NOT the HR file, and sort it by hv001, hv002, hvidx. Then merge with "IR MR temp.dta". Then save cases that are in both files. Good luck!
