---

hi there,

pls i am trying to get the actual age at birth, in groups, for women who gave birth in the 5 years preceding the survey. i can only see mother's age at the time of survey, mother's age at first birth, age at first cohabitation and age at first sex. is there a way for me to generate this variable on STATA, or do i have to manually calculate it? how do i go about it anyway? thanks
