Subject: Difference in anthro variables Posted by duke2015 on Tue, 10 Mar 2015 15:57:41 GMT View Forum Message <> Reply to Message

Hi there,

I am working with a dataset that has merged the household data with the children's data in the 2011 Uganda DHS. Can you please explain the difference in the HC70 variable from the household dataset and the HW70 variable?

Can you tell me what the unweighted sample sizes of each should be?

Thank you!
